MAYO
POTATO WASHER
MODEL 8000 SERIES
OPERATOR’S MANUAL
MAYO MANUFACTURING, INC. LIMITED WARRANTY

THE FOLLOWING WARRANTIES FOR MACHINERY, EQUIPMENT OR PARTS SOLD BY MAYO MANUFACTURING, INC. ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, OR THOSE WARRANTIES IMPOSED BY STATUTE, INCLUDING, BUT NOT LIMITED TO ANY AND ALL IMPLIED WARRANTIES OR MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE AND OF ANY AND ALL OTHER WARRANTY OBLIGATIONS ON THE PART OF MAYO MANUFACTURING, INC. (The Company).

The Company warrants the machinery, equipment or parts delivered against faulty workmanship or the use of parts delivered against faulty workmanship or the use of defective materials for a period of one (1) year from the date of shipment.

The Company's warranties set forth above are the only warranties made by the Company and shall not be enlarged, diminished or affected by, and no obligation or liability shall arise out of the Company's rendering technical or other advice or service in connection with the machinery, equipment or parts.

Parts or components furnished to the Company by third persons are guaranteed only to the extent of the original manufacturer’s guarantee to the Company, a copy of which will be supplied to the Purchaser upon written request to the Company.

LIABILITY

THE COMPANY’S SOLE AND EXCLUSIVE MAXIMUM LIABILITY, AND PURCHASER’S SOLE AND EXCLUSIVE REMEDY under the above warranty shall be, at the Company’s option, the repair, or replacement of the machine, equipment or part which is found to be defective due to faulty workmanship or defective materials, and is returned by the Purchaser to the Company within the warranty period. Shipment both ways and in transit damage shall be at the purchaser’s risk and expense. If the Company elects to repair or replace the machine, equipment, or part, the Company will have a reasonable time within which to do so.

The remedies set forth above are available upon the following conditions:
1. Purchaser has promptly notified Company upon discovery that the machinery, equipment, or parts are defective due to faulty workmanship or defective materials; and
2. Purchaser provides Company with a detailed description of the deficiencies; and
3. Company’s examination discloses that the alleged deficiencies exist and were not caused by accident, fire, misuse, neglect, alteration, or any other hazard or by Purchaser’s improper installation, use or maintenance.

Such repair or replacement shall constitute fulfillment of all Company’s liability to Purchaser, whether based on contract or tort.

This warranty does not apply to any machine that has been altered outside the factory in any way so as, in the judgment of Mayo, to affect its operation, reliability or safety, or which has been subject to misuse, neglect or accident.

In the event the Company breach any other provisions of the Purchase Agreement, the Company’s EXCLUSIVE MAXIMUM LIABILITY AND PURCHASER’S EXCLUSIVE REMEDY, whether in contract or tort, otherwise shall not in any event exceed the contract price for the particular machine, piece of equipment or parts involved.

IN NO EVENT SHALL COMPANY BE LIABLE TO ANYONE FOR SPECIAL, COLLATERAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES FOR BREACH OF ANY PROVISIONS OF THIS CONTRACT OR WARRANTY. SUCH EXCLUDE DAMAGES INCLUDE, BUT ARE NOT LIMITED TO, costs of REMOVAL AND REINSTALLATION OF ITEMS, Loss of GOODWILL, LOSS OF PROFITS, LOSS OF USE OR INTERRUPTION OF BUSINESS.

WARRANTY VOID IF NOT REGISTERED

SERIAL NUMBER LOCATION

Always give your dealer the serial number of your Mayo Potato Washer when ordering parts or requesting service or other information.

The serial number plate is located where indicated. Please mark the number in the space provided for easy reference.

Model _______________________________________

Serial Number __________________________________
1 INTRODUCTION

Congratulations on your choice of a Mayo Model 8000 SERIES Potato Washer and welcome to Mayo’s quality line of potato handling equipment. This equipment is designed and manufactured to meet the needs of a discriminating buyer in the agricultural industry for the loading and processing of harvest yields.

Safe, efficient and trouble free operation of your new Mayo Potato Washer requires that you, and anyone else who will be operating or maintaining the Washer, read, understand and practice ALL of the Safety, Operation, Maintenance and Trouble Shooting recommendations contained within this Operator’s Manual.

This manual applies to most Model 8000 Series Potato Washers manufactured by Mayo. Certain options may be available to specifically tailor the Washer to your operation and may not be included in this manual. Please contact the manufacturer regarding additional information about these options. Use the Table of Contents and Index as a guide to find specific information.

Keep this manual handy for frequent reference and so that it will be passed on to new operators or owners. Call your Mayo dealer if you need assistance, information or additional copies of this manual.

MACHINE ORIENTATION -The hopper end of the conveyor is the front. All controls are on the left side.
2  SAFETY

SAFETY ALERT SYMBOL

This Safety Alert symbol means
ATTENTION! BECOME ALERT!
YOUR SAFETY IS INVOLVED!

The Safety Alert symbol identifies
important safety messages on your
Mayo Potato Washer and in the
manual. When you see this symbol,
be alert to the possibility of personal
injury or death. Follow the instruc-
tions in the safety message.

Why is SAFETY important to you?

3 Big Reasons

Accidents Disable and Kill
Accidents Cost You Money
Accidents Can Be Avoided

SIGNAL WORDS:

Note the use of the signal words DANGER,
WARNING and CAUTION with the safety
messages. The appropriate signal word for
each message has been selected using the
following guide-lines:

DANGER - Indicates an imminently hazardous
situation that, if not avoided, will result
in death or serious injury. This signal
word is to be limited to the most
extreme situations, typically for ma-
chine components that, for functional
purposes, cannot be guarded.

WARNING - Indicates a potentially hazardous
situation that, if not avoided, could
result in death or serious injury, and
includes hazards that are exposed
when guards are removed. It may also
be used to alert against unsafe prac-
tices.

CAUTION - Indicates a potentially hazardous
situation that, if not avoided, may result
in minor or moderate injury. It may
also be used to alert against unsafe
practices.

If you have any questions not answered in this manual or require additional copies or the manual is damaged,
please contact your dealer or Mayo, P.O. Box 497, Bus Highway 2, East Grand Forks, Minnesota, 56721.
(Telephone) 218-773-1234, (FAX) 218-773-6693 or toll free at 1-800-223-5873.
SAFETY

YOU are responsible for the SAFE operation and maintenance of your Mayo Potato Washer. YOU must ensure that you and anyone else who is going to operate, maintain or work around the Potato Washer be familiar with the operating and maintenance procedures and related SAFETY information contained in this manual. This manual will take you step-by-step through your working day and alerts you to all good safety practices while operating the Washer. Remember, YOU are the key to safety. Good safety practices not only protect you but, also the people around you. Make these practices a working part of your safety program. Be certain that EVERYONE operating this machine is familiar with the procedures recommended and follows safety precautions. Remember, most accidents can be prevented. Do not risk injury or death by ignoring good safety practices.

- Potato Washer owners must give operating instructions to operators or employees before allowing them to operate the Washer, and at least annually thereafter.

- The most important safety device on this equipment is a SAFE operator. It is the operator’s responsibility to read and understand ALL Safety and Operating instructions in the manual and to follow these. All accidents can be avoided.

- A person who has not read and understood all operating and safety instructions is not qualified to operate this machine. An untrained operator exposes himself and bystanders to possible serious injury or death.

- Do not modify the equipment in any way. Unauthorized modification may impair the function and/or safety and could affect the life of the equipment.

- Think SAFETY! Work SAFELY!

2.1 GENERAL SAFETY

1. Read and understand the Operator’s Manual and all safety signs before supplying power, operating, maintaining or adjusting Washer.

2. Only trained, competent persons shall operate the Washer. An untrained operator is not qualified to operate this machine.

3. Provide a first-aid kit for use in case of an accident. Store in a highly visible place.

4. Provide a fire extinguisher for use in case of an accident. Store in a highly visible place.

5. Wear appropriate protective gear. This list includes but is not limited to:

   - Protective shoes with slip resistant soles
   - Protective glasses or goggles
   - Heavy gloves
   - Hearing protection

6. Turn machine OFF, shut down and lockout power supply, and wait for all moving parts to stop before servicing, adjusting, maintaining, repairing or cleaning. (Safety lockout devices are available through your Mayo dealer parts department).

7. Know the emergency medical center number for your area.

8. Review safety related items with all operators annually.
2.2 INSTALLATION SAFETY

1. Disconnect and remove all mechanical locks, anchor chains and any other transport devices that would hinder or prohibit the normal functioning of the Washer upon start up. Serious damage to the machine and/or personal injury to the operator and bystanders may result from attempting to operate the machine while mechanical locking devices are still attached.

2. Position the machine on firm, level ground before operating.

3. Have at least one extra person available to assist when elevating, moving or connecting to other equipment.

4. Make certain that sufficient amperage, at the proper voltage and frequency is available before connecting power. If you are uncertain, have a licensed electrician provide power to the machine.

5. If using Washer as part of material handling system, anchor securely to other conveying equipment before starting.

2.3 OPERATING SAFETY

1. Read and understand the Operator’s Manual and all safety signs before operating, maintaining, adjusting or repairing the Washer.

2. Turn machine OFF, shut down and lock out power supply (safety lockout devices are available through your Mayo dealer parts department), and wait for all moving parts to stop before servicing, adjusting, maintaining or repairing.

3. Install and properly secure all guards and shields before operating.

4. Keep hands, feet, hair and clothing away from all moving parts.

5. Clear the area of bystanders, especially small children, before starting.

6. Make sure all control switches are in the off position before connecting power supply.

7. Before supplying electrical power to the machine, be sure that you have adequate amperage at the proper phase and voltage to run it. If you do not know or are unsure, consult a licensed electrician.

8. Keep the working area clean and dry.

9. Review safety instructions annually.
2.4 MAINTENANCE SAFETY

1. Read and understand all the information contained in the Operator’s Manual regarding operating, servicing, adjusting, maintaining and repairing.
2. Turn machine OFF, shut down and lock out power supply (safety lockout devices are available through your Mayo dealer parts department), and wait for all moving parts to stop before servicing, adjusting, maintaining or repairing.
3. Follow good shop practices:
   - Keep service area clean and dry.
   - Be sure electrical outlets and tools are properly grounded.
   - Use adequate light for the job at hand.
4. Make sure all guards and doors are in place and properly secured when operating the Washer.
5. Do not work on Washer electrical system unless the power cord is unplugged and the power supply is locked out.

2.5 ELECTRICAL SAFETY

1. Have only a qualified electrician supply power.
2. Make certain that the Washer is properly grounded at the power source.
3. Make certain that all electrical switches are in the OFF position before plugging the Washer in.
4. Turn machine OFF, shut down and lock out power supply (safety lockout devices are available through your Mayo dealer parts department), and wait for all moving parts to stop before servicing, adjusting, maintaining or repairing.
5. Disconnect power before resetting any motor or breaker overload.
6. Replace any damaged electrical plugs, cords, switches and components immediately.
7. Do not work on Washer electrical system unless the power cord is unplugged or the power supply is locked out.

2.6 TIRE SAFETY

1. Inflate tires to proper pressure as specified on the side wall of each tire. Do not overinflate or underinflate.
2. Failure to follow proper procedures when mounting a tire on a wheel or rim can produce an explosion which may result in serious injury or death.
3. Do not attempt to mount a tire unless you have the proper equipment and experience to do the job.
4. Have a qualified tire dealer or repair service perform required tire maintenance.
2.7 TRANSPORT SAFETY

1. Make certain that you are in compliance with local, state/provincial and federal regulations regarding transporting agricultural equipment on public roadways.
2. Make certain that all wheels and tires are in good repair and that tires are inflated to proper pressure. Do not underinflate or overinflate.
3. Make certain that all wheel bolts/lug nuts are tightened to proper torque specifications (refer to specification chart in Section 7.2).
4. Make certain that all mechanical locks and integral anchor chains are safely and positively connected before loading or transporting.
5. Raise and secure all jack stands.
6. Wrap up and bind to the frame all loose water line and electrical ends.
7. Be sure that any necessary SMV (slow moving vehicle) signs, reflectors and lights required by law are in proper place and are clearly visible to oncoming and overtaking traffic.
8. Be sure that the Washer is positively hitched to the towing vehicle. Use a proper safety chain to assure a safe hitch hook-up when transporting.
9. Adhere to local regulations regarding maximum weight, width and length.
10. Do not exceed 20 MPH (32 KmlH). Reduce speed on rough roads and surfaces.
11. Do not allow anyone to ride on the Washer or towing vehicle during transport.
12. Always use hazard flashers on the towing vehicle when transporting.

2.8 STORAGE SAFETY

1. Store the Washer on a firm level surface.
2. If required, make sure the unit is firmly blocked up.
3. Make certain that all mechanical locks are safely and positively connected before storing.
4. Store away from areas of human activity.
5. Do not allow children to play on or around the stored Washer.
6. Lock out power by turning off master control panel or junction box and padlocking the door shut to prevent electrocution or unauthorized start up of the Washer.

2.9 SAFETY SIGNS

1. Keep safety signs clean and legible at all times.
2. Replace safety signs that are missing or have become illegible.
3. Replaced parts that displayed a safety sign should also display the current sign.
4. Safety signs are available from your Distributor or the factory.

How to Install Safety Signs:

- Be sure that the installation area is clean and dry.
- Decide on the exact position before you remove the backing paper.
- Remove the smallest portion of the split backing paper.
- Align the sign over the specified area and carefully press the small portion with the exposed sticky backing in place.
- Slowly peel back the remaining paper and carefully smooth the remaining portion of the sign in place.
- Small air pockets can be pierced with a pin and smoothed out using the piece of sign backing paper.
2.10 EMPLOYEE SIGN-OFF FORM

Mayo Manufacturing, Inc. follows the general Safety Standards specified by the American Society of Agricultural Engineers (ASAE) and the Occupational Safety and Health Administration (OSHA). Anyone who will be operating and/or maintaining a Mayo built machine must read and clearly understand ALL Safety, Operating and Maintenance information presented in this manual.

Do not operate or allow anyone else to operate this equipment until such information has been reviewed. Annually review this information before the season start-up.

Make these periodic reviews of SAFETY and OPERATION a standard practice for all of your equipment. We feel that an untrained operator is unqualified to operate this machine.

A sign-off sheet is provided for your record keeping to show that all personnel who will be working with the equipment have read and understand the information in the Operator’s Manual and have been instructed in the operation of the equipment.

3 SAFETY SIGN LOCATIONS

The types of safety signs and locations on the equipment are shown in the illustration below. Good safety requires that you familiarize yourself with the various safety signs, the type of warning and the area, or particular function related to that area, that requires your SAFETY AWARENESS.

• Think SAFETY! Work SAFELY!

REMEmBER - If safety signs have been damaged, removed, become illegible or parts replaced without safety signs, new signs must be applied. New safety signs are available from your authorized dealer.
SAFETY SIGN LOCATIONS (cont’d)

### 4.1 TO THE NEW OPERATOR OR OWNER

The Mayo Manufacturing Potato Washer is designed to wash potatoes to remove dirt, mud and residue prior to shipment for processing. Be familiar with the machine before starting.

It is the responsibility of the owner or operator to read this manual and to train all other operators before they start working with the machine. Follow all safety Instructions exactly. Safety is everyone’s business. By following recommended procedures, a safe working environment is provided for the operator, bystanders and the area around the worksite. Untrained operators are not qualified to operate the machine.

Many features incorporated into this machine are the result of suggestions made by customers like you. Read this manual carefully to learn how to operate the machine safely and how to set it to provide maximum efficiency. By following the operating instructions in conjunction with a good maintenance program, your Potato Washer will provide many years of trouble-free service.
4.2 MACHINE COMPONENTS
The Mayo Manufacturing Potato Washer consists of a hopper, elevator, wash bed and discharge for cleaning potatoes prior to shipment for processing. A washer is a component within a conveying line and is used to clean the potatoes.

An optional elevator moves the potatoes from the hopper up to the washing bed for scrubbing. Recycled wash water flows through a system of nozzles above the elevator and wash bed to loosen and remove dirt. The optional elevator is used as a soak or pre-wash area for the potatoes. A strong water spray from the nozzles coupled with brush rollers are used in the wash bed to remove dirt.

A set of nozzles across the wash bed discharge use fresh clean water to provide a final rinse as the potatoes leave the wash bed. Sponge rollers after the wash bed remove excess water from the potatoes. Compression rollers remove excess water from the sponge rollers. All the soak, wash, and rinse water drops into the collector where it is pumped out and discharged or recycled.

All electrical controls are mounted on a central control panel.
Ratchet jacks on each corner are used to level the machine and remove the weight from the tires. A removable hitch is used for transporting.

Fig. 1 MACHINE COMPONENTS
4.3 GENERAL OPERATION THEORY

A Potato Washer is positioned in the line of conveying equipment that loads trucks to take the potatoes for processing. This unit can be located at a storage or transfer facility and used prior to the potatoes being loaded into the transport truck. Fresh and recycled (cleaned or filtered) water must be provided to the machine by the customer at the required volume and pressure for optimum performance. Insufficient volume and pressure will compromise the washing performance.

Potatoes are fed into the optional elevator hopper of the Washer by one of several types of conveying machines which could include, but is not limited to a telescoping conveyor, a straight conveyor, a sizing conveyor, a chain conveyor, a transport truck, a holding hopper, etc.

From the elevator hopper the potatoes are carried by an optional chain conveyor up into the washing bed. When the potatoes are scrubbed, cleaned and finally rinsed with clean water at the end of the wash bed, they are discharged out the back of the machine. The customer must provide a means to remove the clean potatoes from the washer as they are discharged.

Minimize all drop heights to prevent bruising of the potatoes.

Fig. 2 POSITIONED (TYPICAL)
4.4 MACHINE BREAK-IN
Although there are no operational restrictions on the Washer when used for the first time, it is recommended that the following mechanical items be checked:

A. Read Washer and auxiliary equipment manuals before starting.

B. After operating for 1/2 hour:
   1. Retorque all wheel bolts.
   2. Retorque all other fasteners and hardware.
   3. Check the alignment of the optional conveyor chain. Realign as required.
   4. Check that all electrical connections are tight and cords are routed out of the way or protected.
   5. Check for leaks in water system.
   6. Check that no water lines are being pinched or crimped. Reroute as required.
   7. Check the alignment and tension of all drive belts and chains. Realign or tighten as required.
   8. Check all drive sprockets and pulleys to make sure none has moved. Re-align and tighten any that has moved.
   9. Check oil level in each speed reduction gear box for each drive. Top up as required.
  10. Lubricate all grease fittings.

C. After 2, 5 and 10 hours of operation:
   1. Retorque all fasteners and hardware.
   2. Check the alignment of the optional conveyor chain. Realign as required.
   3. Check that all electrical connections are tight and cords are routed out of the way or protected.
   4. Check for leaks in water system. Retorque fittings that leak.
   5. Check that no water lines are being pinched or crimped. Reroute as required.
   6. Check the alignment and tension of all drive belts and chains. Realign or tighten as required.
   7. Check all drive sprockets and pulleys to make sure none has moved. Re-align and tighten any that has moved.
   8. Check oil level in each speed reduction gear box for each drive. Top up as required.
   9. Then go to the regular servicing and maintenance schedule as defined in the Maintenance Section.

4.5 PRE-OPERATION CHECKLIST
Safe and efficient operation of your new Washer requires that each operator reads and follows all safety precautions and operating procedures contained in this section. Performing the following pre-operation checklist is important for personal safety as well as for continued mechanical soundness and longevity of your new Mayo Washer. The checklist should be performed before operating the Washer and prior to each operation thereafter.

1. Lubricate the machine according to the schedule prescribed in the “Maintenance Section”.
2. Insure that proper protective gear is in good repair and available for use by each operator. Make certain that each operator uses the protective gear. Protective gear includes but is not limited to:
   - Leather gloves
   - Safety glasses or face shield
   - Full-length protective clothing
   - Steel toed boots with slip resistant soles.
3. Check for water leaks. Tighten fittings or reroute hoses as required to maintain a leak-free system.
4. Insure that all safety guards and shields are in good repair and securely in place.
5. Check that the optional conveyor chain is centered on the head and tail rollers. Adjust if necessary as outlined in the “Maintenance Section”.
6. Check that all drive belts and chains are properly tensioned and aligned. Adjust if required.
7. Check the condition of the brush and foam rollers. Replace any that are damaged, clogged or broken.
8. Check for and remove all entangled material.
9. Make sure that all electrical switches are in the OFF position before supplying power.
10. Check that all electrical connections are tight and cords are routed out of the way or protected.
11. Be sure the working area is clean and dry to prevent tripping or slipping.
4.6 CONTROLS

It is recommended that all operators review this section of the manual to familiarize themselves with the location and function of all machine controls before starting. Some machines may vary slightly due to custom features but they are similar and all controls are labeled.

1. **Master OFF/ON:**
   This 2 position rotary switch controls the power to the control panel. Turn counterclockwise to turn OFF and clockwise to turn ON. The switch must be turned ON before using any other switch or function.

2. **Trash Pump STOP/START:**
   This 2 position rotary switch controls the power to trash pump electric motor. Turn counter-clockwise to turn OFF and clockwise to turn ON. This pump removes the wash water from the bottom of the machine.

3. **Elevator STOP/START:**
   This 2 position rotary switch controls the power to the electric motor that drives the elevator. Turn counter-clockwise to turn OFF and clockwise to turn ON.

4. **Brush Rollers STOP/START:**
   This 2 position rotary switch controls the power to the electric motor driving the brush rollers. Turn counter-clockwise to turn OFF and clockwise to turn ON.

5. **Sponge Rollers STOP/START:**
   This 2 position rotary switch controls the power to the electric motor driving the sponge rollers. Turn counter-clockwise to turn OFF and clockwise to turn ON.

6. **Emergency STOP Control:**
   This red push/pull button is the emergency STOP control for the machine and stops all functions. Push the control in for emergency STOP. Place all the individual controls in their OFF position. Before the machine can be restarted, the Emergency STOP button must be pulled out. If the individual controls are not all placed in their OFF position when the STOP button is pulled out, all the motors will try to start at the same time. **DO NOT use the emergency STOP switch as a master start switch.**
4.7 MACHINE PREPARATION

The machine must be properly prepared prior to using. Before starting machine, be sure that the following items are appropriate for your machine and operating requirements:

1. **Power:**

   Have a licensed electrician provide power at the required voltage, phase and amperage for your machine. An Improper source of power will cause damage to electrical components and could create an electrical hazard to the operator, worker or bystanders.

   Be sure to use an extension cord of the correct specifications for the power being carried. Route the cord so that it does not interfere with the working area. Provide appropriate protection when people or equipment must go over the cord. Inspect the cord occasionally to be sure it is not damaged. Replace immediately if it is damaged.

2. **Hitch:**

   Each machine is equipped with a removable hitch that is used to move and transport the washer. Remove the anchor bolt and slide the hitch out of the frame to prevent tripping.

3. **Frame Jacks:**

   The machine is equipped with jacks on each frame corner. Lower jacks to the ground to carry the weight when the machine is in its operating position. Raise jacks to their up position for moving and transporting.
4. Water Supply:
Provide a 200 gpm 35-40 psi source of water to the machine. Normally the water from the bottom sump is filtered or cleaned and then recycled back through the wash nozzle system. The Mayo 12000 Series Recirculating Tank works well for recycling and cleaning an adequate supply of water. In addition, a 3 gpm 35-40 psi source of fresh water is required for the final rinse.

5. Auxiliary Equipment:
Each customer must provide a means of bringing a flow of potatoes to the hopper end and removing them from the discharge end. Normally this is done by another piece of equipment such as a grader or another conveyor. Always connect the adjacent equipment securely to the washer to prevent movement.
4.8 OPERATING

OPERATING SAFETY

1. Read and understand the Operator’s Manual and all safety signs before operating, maintaining, adjusting or repairing the Washer.

2. Turn machine OFF, shut down and lock out power supply (safety lockout devices are available through your Mayo dealer parts department), and wait for all moving parts to stop before servicing, adjusting, maintaining or repairing.

3. Install and properly secure all guards and shields before operating.

4. Keep hands, feet, hair and clothing away from all moving parts.

5. Clear the area of bystanders, especially small children, before starting.

6. Make sure all control switches are in the off position before connecting power supply.

7. Before supplying electrical power to the machine, be sure that you have adequate amperage at the proper phase and voltage to run it. If you do not know or are unsure, consult a licensed electrician.

8. Keep the working area clean and dry.

9. Review safety instructions annually.

Follow this procedure when using the Washer:

1. Review Section 4.7 Machine Preparation and follow all the instructions.

2. Review and follow the pre-operation checklist (See Section 4.5).

3. Review the location and function of all controls (See Section 4.6).

4. Water Supply:

   a. Provide a supply of recycled water to the machine using the over-center cam lock coupler provided with the machine to the 2 inch input line. Be sure the cam locks go over center to provide a good seal.

   b. Provide a supply of fresh water to the 3/4” final rinse line. Be sure the cam locks go over center to provide a good seal.

   c. Attach the 4 inch sump outlet to the recycling machine line. Be sure the cam lock coupler goes over-center to provide a good seal.

Fig. 8 WATER SUPPLY
5. Starting Washer:
   a. Clear the area of bystanders. Know where everyone is before starting.
   b. Place all controls in the OFF position.
   c. Turn the power to the machine ON at the master panel.
   d. Turn the master power switch ON (Refer to Section 4.7 Controls).

   **NOTE**
   Be sure the red Emergency Stop switch is pulled out.

   e. Turn the water supply ON.
   f. Turn the trash pump ON.
   g. Turn the sponge rollers ON.
   h. Turn the brush rollers ON.
   i. Turn the optional elevator ON.
   j. Turn the equipment ON that moves potatoes to and from the Washer.

6. Stopping machine:
   a. Turn OFF the equipment that brings potatoes to the Washer.
   b. Wait until the potatoes have moved out the end of the Washer.
   c. Turn the optional elevator OFF.
   d. Turn the brush rollers OFF.
   e. Turn the sponge rollers OFF.
   f. Turn the trash pump OFF.
   g. Turn the Master OFF/ON switch OFF.
   h. Turn the water supply OFF.

   An alternative is to depress the red Emergency STOP button on the control panel but the operator must go through steps a through h to turn all the controls OFF before restarting.

7. Emergency STOP:
   Depress the large red STOP button on the control panel. This will stop the elevator, rollers and trash pump. Be sure to turn all the individual control switches to their OFF position and pull the Emergency Stop button out before restarting the machine.
8. **Auxiliary Equipment:**

Provide a means for bringing a flow of potatoes to the hopper end and a means for removing them from the discharge. Since the Washer is positioned on jacks for operation, it will not move. Do not allow the auxiliary equipment to move. Normally connecting them will prevent movement.

9. **Moving:**

All machines are equipped with a removable hitch on the hopper end that is secured with an anchor bolt. The hitch can be removed if desired if it interferes with the working area.

Raise the jack stands and disconnect the water and power supplies prior to moving the machine. Always install lights and an SMV emblem before transporting on a public road.

10. **Machine Speed:**

The input drives for the elevator and each type of roller are equipped with a variable pulley belt drive for setting the machine speeds. Use cleanliness of the potatoes out of the discharge as a guide when setting the speed of the machine.

Increase the speed of the systems if the potatoes are clean and decrease if the potatoes are not clean. Move the drive pulley closer to the driven pulley to increase speed and away to decrease.

Normally, the optional elevator is set to run slowly to allow the potatoes to soak before they get to the brush rollers. Use this as a pre-wash or soak cycle.
11. **Nozzles:**

Nozzles are used in the wash circuit to distribute the water over the potatoes. A wide angle nozzle is used over the optional elevator to be sure that there is sufficient water for a good pre-soak to wet and loosen dirt.

Nozzles with a narrow spray angle for higher force are used over the wash bed to assist the brushes in removing dirt from the potatoes.

Check the spray pattern from the nozzles every 8-10 hours to be sure that none of the nozzles are plugged or have a poor spray pattern. When this occurs, clean or replace them.
12. **Rollers:**

Three types of rollers are used on the machine and perform special functions:

a. **Brush Rollers:**

These rollers are positioned under the washing bed to roll the potatoes and brush away the dirt. They function best when the flow of potatoes is one level deep. Allow the water to run for at least 1 minute after all the potatoes have passed through the washing bed to clean the brushes.

b. **Sponge Rollers:**

These rollers are used under the drying bed to remove any excess water from the potatoes before they are discharged from the machine. Wash the rollers with a garden hose using fresh water to clean if required. Replace if damaged.

c. **Squeeze Rollers:**

These rollers are used under the sponge rollers to squeeze the sponge and remove all excess moisture from the roller. Compressing the sponge on the roller 1/4 inch is sufficient to remove the excess moisture. Compressing more than 1/4 inch will only damage the sponge without removing any more moisture.
13. **Bruising:**

Potatoes are sensitive to bruising during the gathering, transporting, storage and handling phases of their growing. Bruising is kept to a minimum by maintaining a full flow of potatoes through each machine and minimizing all drop heights. Bruising, during the washing phase, can be minimized by keeping the drop height between each machine as small as possible.

14. **Water Quality:**

It is recommended that the customer provide a means to clean the wash water as it is pumped out of the sump. Although filters or cleaning systems remove the dirt and trash, they do not remove all the fines. After recycling the water for a period of time, the fines will accumulate and the water will get dirty. Change the water when this happens.

15. **Operating Hints:**

a. Be sure that all workers and operators are supplied with and use the required safety gear.

b. Keep the working area clean and as dry as possible to prevent slipping and tripping.

c. Train all operators before starting. An untrained operator is not qualified to operate this machine and can expose himself and others to needless hazards.

d. Secure all pieces of equipment together to prevent unexpected movement and separation.

e. Keep the elevator as full as possible to minimize bruising during the washing process.
4.9 TRANSPORT

TRANSPORT SAFETY

1. Make certain that you are in compliance with local, state/provincial and federal regulations regarding transporting agricultural equipment on public roadways.

2. Make certain that all wheels and tires are in good repair and that tires are inflated to proper pressure. Do not underinflate or overinflate.

3. Make certain that all wheel bolts/lug nuts are tightened to proper torque specifications (refer to specification chart in section 7.2).

4. Make certain that all mechanical locks and integral anchor chains are safely and positively connected before loading or transporting.

5. Raise and secure all jack stands.

6. Wrap up and bind to the frame all loose water lines and electrical ends.

7. Be sure that any necessary SMV (slow moving vehicle) signs, reflectors and lights required by law are in proper place and are clearly visible to oncoming and overtaking traffic.

8. Be sure that the Washer is positively hitched to the towing vehicle. Use a proper safety chain to assure a safe hitch hook-up when transporting.

9. Adhere to local regulations regarding maximum weight, width and length.

10. Do not exceed 20 MPH (32 Km/H). Reduce speed on rough roads and surfaces.

11. Do not allow anyone to ride on the Washer or towing vehicle during transport.

12. Always use hazard flashers on the towing vehicle when transporting.

Mayo Washers are designed to be easily and conveniently moved from location to location. The term moving is used to describe the action of moving the machine within a storage facility. Transporting is used to describe when the machine is being towed by a tractor or other power unit on a public highway. When transporting, follow this procedure:

1. Disconnect and remove all auxiliary equipment from the Washer and position so the tractor can back up to the front of the machine.

2. Disconnect the water supply and sump hoses. Drain the sump and plumbing.

Fig. 17 WATER HOSES
4.9 TRANSPORT (cont’d)

3. Install and secure the tow hitch.
4. Attach the tow hitch to the tractor. Be sure to use a mechanical retainer through the drawbar pin.
5. Attach a safety chain between the hitch and the drawbar cage to prevent unexpected separation.
6. Install an SMV on the rear frame.
7. Use pilot vehicles or install extra lights on the machine when transporting.
8. Clean all the reflectors.
9. Place all controls in their OFF or neutral position.
10. Turn the power OFF at the master panel and lock out.
11. Unplug and remove the power cord.
12. Be sure all bystanders are clear of the machine.
13. Keep to the right and yield the right-of-way to allow faster traffic to pass. Drive on the road shoulder, if permitted by law.
14. Make sure the SMV (Slow Moving Vehicle) emblem and all the lights and reflectors that are required by the local highway and transport authorities are in place, are clean and can be seen clearly by all overtaking and oncoming traffic.
15. It is not recommended that the machine be relative to weight of transported faster than 20 mph (32 km/hr). Table 1 gives the acceptable transport speed as the ratio of tractor weight to Washer weight.
16. Do not allow riders on the machine or tractor.
17. Always use hazard flashers on the tractor when transporting unless prohibited by law.

Fig. 18 TOW HITCH

</tr>
<tr>
<td>Up to 16 km/h (10 mph)</td>
<td>2 to 1, or less</td>
</tr>
<tr>
<td>Do not tow</td>
<td>More than 2 to 1</td>
</tr>
</tbody>
</table>
4.10 STORAGE

STORAGE SAFETY

1. Store the Washer on a firm level surface.
2. If required, make sure the unit is firmly blocked up.
3. Make certain that all mechanical locks are safely and positively connected before storing.
4. Store away from areas of human activity.
5. Do not allow children to play on or around the stored Washer.
6. Lock out power by turning off master control panel or junction box and padlocking the door shut to prevent electrocution or unauthorized start up of the Washer.

4.10.1 PLACING IN STORAGE

At the end of the season, the machine should be thoroughly inspected and prepared for storage. Repair or replace any worn or damaged components to prevent any unnecessary down time at the beginning of the next season. Follow this procedure:

1. Use fresh water to flush the water system to remove all contaminants. Check the spray pattern of each nozzle. Clean or replace any nozzle with an unusual pattern.
2. Check all rotating parts for entangled material. Remove.
3. Inspect the optional conveyor chain. Realign if the chain is not tracking in the sprockets. Properly tension the chain if required.
4. Turn the power OFF at the master electrical panel and lock out.
5. Unplug and remove power cord from machine.
6. Thoroughly wash the machine using a pressure washer to remove all dirt, mud, debris or residue. Be sure the brush and sponge rollers are cleaned.
7. Lubricate all grease fittings. Make sure all grease cavities have been filled with grease to remove any water residue from the washing.
8. Inspect all the water hoses, lines, fittings and nozzles. Tighten any loose fittings. Replace any hose that is badly cut, nicked, abraded or separating from a fitting. Replace any damaged components.
9. Inspect all the electrical cords, lines, junction boxes and motors. Tighten any loose connections. Replace any cord that is badly cut, nicked or abraded. Replace any damaged components.
10. Inspect each conveyor drive system. Check the condition of the roller chains and belts. Replace any if badly worn. Check the alignment of the sprockets and pulleys. Align if required. Properly tension each drive chain.
11. Apply a light coat of oil to each roller chain to prevent rusting.
12. Touch up all paint nicks and scratches to prevent rusting.
13. Select a storage area that is dry, level and free of debris.
14. Cover with a weather-proof tarpaulin and tie down if stored outside.

4.10.2 REMOVING FROM STORAGE

When preparing to use the machine at the start of the season, follow this procedure:

1. Remove the tarpaulin if covered.
2. Transport or move to the working area.
3. Check
   a. Water and electrical systems and components.
   b. Optional conveyor chains and all drive systems.
   c. All hardware. Tighten as required.
   d. Air pressure in tires. Add as required.
4. Replace any defective components.
5. Go through the pre-operation checklist (Section 4.5) before starting.
5 SERVICE AND MAINTENANCE

MAINTENANCE SAFETY

1. Read and understand all the information contained in the Operator’s Manual regarding operating, servicing, adjusting, maintaining and repairing.

2. Turn machine OFF, shut down and lock out power supply (safety lockout devices are available through your Mayo dealer parts department), and wait for all moving parts to stop before servicing, adjusting, maintaining or repairing.

3. Follow good shop practices:
   - Keep service area clean and dry.
   - Be sure electrical outlets and tools are properly grounded.
   - Use adequate light for the job at hand.

4. Make sure all guards and doors are in place and properly secured when operating the Washer.

5. Do not work on Washer electrical system unless the power cord is unplugged and the power supply is locked out.

5.1 SERVICE

5.1.1 FLUIDS AND LUBRICANTS

1. Grease
   Use an SAE multi-purpose high temperature grease with extreme pressure (EP) performance meeting or exceeding the NLGI #2 rating for all requirements.

2. Speed Reducer Gear Box Lubricant
   Use a Browning Worm Gear high-temperature GL32HT lubricant (AGMA Compo #8) or equivalent.

3. Roller Chain Lubricating Oil

<table>
<thead>

<td>SAE 30</td>
</tr>
</tbody>
</table>

* Stamped on chain link side plate

4. Storing Lubricants
   Your machine can operate at top efficiency only if clean lubricants are used. Use clean containers to handle all lubricants. Store them in an area protected from dust, moisture and other contaminants.

5.1.2 GREASING

Refer to Section 5.1.1 for recommended grease. Use the Maintenance Checklist provided to keep a record of all scheduled maintenance.

1. Use only a hand-held grease gun for all greasing. Air powered greasing systems can damage the seals on bearings and lead to early bearing failure.

2. Wipe grease fitting with a clean cloth before greasing to avoid injecting dirt and grit.

3. Replace and repair broken fittings immediately.

4. If a fitting will not take grease, remove and clean thoroughly. Also clean lubricant pas sageway. Replace fitting if necessary.

5. Conveyor Bearings:
   Only sealed bearings are used on the conveyor and roller bearings. Sealed bearings should never be greased more often than weekly or every 50 hours. Do not over grease. Do not give bearing more than 1 shot of grease each time it is greased. (Once the bearing seal is broken, the bearing must be greased each day or the bearing will fail.)
5.1.3 SERVICING INTERVALS
8 Hours or Daily

1. Oil the elevator drive system roller chain (1 location).

![WARNING]

**ROTATING PART HAZARD**

Keep Away

To prevent serious injury or death from rotating parts:

1. Keep all guards and shields in place.
2. Keep hands, feet, hair, and clothing away from moving parts.
3. Keep others away.

![Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.]

2. Oil the brush roller drive system primary and secondary roller chain (2 locations).

---

**Fig. 19 ELEVATOR DRIVE**

**Fig. 20 BRUSH ROLLER DRIVE**
5.1.3 SERVICING INTERVALS (cont’d)

8 Hours or Dally (cont’d)
3. Oil the sponge roller drive system primary and secondary roller chain (2 locations).

4. Check the optional elevator tension and alignment. Tension or align as required.

5. Inspect water system and all components.

6. Inspect electrical system and all components.

---

A WARNING

ROTATING PART HAZARD
Keep Away
To prevent serious injury or death from rotating parts:

1. Keep all guards and shields in place.

2. Keep hands, feet, hair, and clothing away from moving parts.

3. Keep others away.

---

A WARNING
Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.

---

Fig. 21 SPONGE ROLLER DRIVE
Weekly or 50 Hours
1. Grease elevator drive shaft bearings with 1 shot of grease (2 locations).

**IMPORTANT**
Only sealed bearings are used on the conveyor bearings. Sealed bearings should never be greased more often than weekly or every 50 hours. Do not overgrease. Do not give bearing more than 1 shot of grease each time it is greased. Once the bearing seal is broken, the bearing must be greased each day or the bearing will fail.

2. Grease the brush roller shafts with one shot of grease (2 locations each shaft).
Weekly or 50 Hours (cont’d)

3. Grease the sponge roller shafts with one shot of grease (2 locations each shaft).

4. Grease the compression roller shafts with one shot of grease (2 locations each shaft).
Weekly or 50 Hours (cont’d)

5. Grease trash pump drive bearings (2 locations).
Weekly or 50 Hours (cont’d)
6. Check the roller chain tension and sprocket alignment.
Weekly or 50 Hours (cont’d)

7. Check the oil level in each speed reducing gear box in the drive systems (1 location each gear box).

**WARNING**

Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.

---

**Fig. 28 LEVEL PLUG**

**Fig. 29 GEAR BOX SCHEMATIC (TYPICAL)**
200 Hours or Annually
1. Grease the ratchet jacks (2 locations each jack).

2. Grease the electric motor bearings with 1 shot of grease (2 locations each motor).

**IMPORTANT**
Do not over-grease electric motors. Over-greasing can render the electric motor inoperative.
200 Hours or Annually (cont’d)

3. Change the oil level in each speed reducing gear box in the drive systems.

⚠️ WARNING ⚠️

Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.

5.2 MAINTENANCE

By following a careful service and maintenance program on your machine, you will enjoy many years of trouble-free use.

5.2.1 ELECTRICAL SYSTEM INSPECTION

Electricity provides power to all systems on the Washer. To maintain the integrity of each system and provide a safe working environment for the operator, it is important that a daily inspection be done to make sure that all systems and components are in good working condition. To provide a safe working environment, have a licensed electrician provide power to the machine.

When inspecting the electrical system and components, follow this procedure:

1. Place all controls in the OFF position.
2. Turn power OFF at the master panel and lockout before starting the inspection.

3. Inspect all electrical components looking for:
   a. Damaged plugs.
   b. Frayed wires.
   c. Cut or cracked insulation.

![WARNING]

Do not operate the machine unless the master panel is equipped with a lock-out device. Always engage lock-out device before performing any maintenance work. Lock-out devices are available from your dealer or the factory.

4. Replace any damaged components immediately.
5. Be sure all components are grounded.
6. Be sure there is no water or moisture in any junction box or enclosure. Dry the components before turning power on. Be sure that all compartments seal properly when closed.
5.2.2 ELECTRIC MOTOR RESTART

It is recommended that only a licensed electrician perform maintenance work on the electrical system.

All electric motors are supplied with power through an individual circuit that includes a circuit breaker, switch, contactor and overload relay that are all incorporated into a single electrical component inside the control panel. The contactor is the main connecting device for power to the motor. If the current is greater than the adjustable dial of the relay, the relay will trip and cut off power to the coil of the contactor. When this happens, the contactor dial will move to a new position and indicates the cause of the overload. It must be reset before the motor can be restarted.

When a motor will not start:

1. Turn the switch to its OFF position.
2. Turn the switch to its ON position.
3. If the motor will not start, turn machine OFF and lock out power at the master control panel before opening the control panel.
4. Turn the contactor dial counter-clockwise to the manual reset position. Then, turn the contactor dial clockwise to the ON contactor open position.
5. Close and secure the panel door and turn the power to the machine ON.
6. If the motor still will not start you have one of the following conditions:
   a. The motor is hot and must cool a period of time before attempting to restart.
   b. The overload is adjusted incorrectly for the amperage of the motor and must be properly adjusted.
   c. The overload and/or contactor has fulfilled its service life and is in need of replacement.
   d. The motor is bad and needs replacing.
   e. An electrical short exists somewhere in the circuit.

NOTE

If your conveyor utilizes single phase motors, chances are good that the motor has a thermal overload located on the electrical junction box of the motor itself. If this is the case then, fully depress the reset button to make certain that the overload circuit is closed.

Fig. 37 MOTOR RESTART
5.2.3 SPEED REDUCER GEARBOX OIL

The optional elevator and rollers are driven by an electric motor that is attached to a high ratio speed reducing gearbox to give the required operating speed. Each gearbox is equipped with a drain, level and fill plug. Every 50 hours, the oil level should be checked. Every 200 operating hours or annually, whichever comes first, the oil should be replaced. Check more frequently if there are leaks around any of the plugs or shaft seals. When checking oil level or changing oil, follow this procedure.

1. Run the elevator and rollers until each gearbox is warm. Warm oil will remove more contaminants than cold stagnant oil.

2. Stop the drives.

3. Place all controls in their OFF position.

4. Turn the power OFF at the master panel and lock-out.

5. Checking oil level:
   a. When the gearbox is cold, remove the level plug from the side of the gearbox.
   b. When the oil just fills the threads of the level plug, it is at the correct level.
   c. Add oil through the fill plug as required.
   d. Install and tighten level and fill plugs.

6. Changing oil:
   a. Place a container under the drain plug.
   b. Remove the drain, level and fill plugs.
   c. Allow 10 minutes to drain.
   d. Install and tighten the drain plug.
   
   **NOTE**
   It may be necessary to add teflon tape or pipe sealant to the drain plug prior to installation to prevent leaking.

   e. Add Browning Worm Gear GL 32HT lubricant or equivalent. Use the level plug to determine the proper amount of oil.

   f. Check that the air passage through the breather is open.

   g. Install and tighten the fill and level plugs.

   h. Dispose of the used oil in an environmentally safe manner.

---

**WARNING**

Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.
5.2.4 BREATHER CLEANING

Each gearbox is equipped with a breather in the fill plug that vents the internal pressure to atmosphere. As the gearbox temperature increases and decreases during the operating and stopped modes, the pressure in the gearbox will increase or decrease if it is not vented to atmosphere. An increase in internal pressure will cause the shaft seals to leak until the gearbox runs low on or out of oil. To check on or clean the breather, follow this procedure:

1. Place all controls in their OFF position.
2. Turn the power OFF at the master panel and lock-out.
3. Remove the fill plug/breather from the gearbox.
4. Check that the vent passage through the plug is open.
5. If plugged, soak in a solvent over night.
6. Use a high-pressure air hose to blow the passage open. Use a probe to clear the passage if the hole is caked with dirt.
7. Install and tighten the breather plug.

**IMPORTANT**
Always clean the breather if any leaks are noticed around shafts.

**WARNING**
Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.
5.2.5 OPTIONAL ELEVATOR CHAIN TENSION/ALIGNMENT OR REPLACEMENT

A potato chain is used on the optional elevator. The tension and alignment of the conveyor should be checked daily to insure proper function. Replace the conveyor chain when damaged or badly worn. To maintain conveyor, follow this procedure:

1. Place all controls in their OFF or neutral position.
2. Turn the power OFF at the master panel and lock-out.
3. **Tension:**
   - It is tensioned correctly when there is a 3 to 4 inch (75 to 100 mm) sag between the guide rollers on the bottom or slack side of the conveyor during operation.
4. **Alignment:**
   - It is properly aligned when the chain links center on the drive sprockets. If the links run on the side of the sprockets, align the chain. Align by loosening the shaft bearing assembly on the tight side or tightening the bearing assembly on the loose side. Move the bearing assemblies on the drive shaft but always maintain the proper tension.
5. **Replacement:**
   a. Move the drive shaft into its loosest position.
   b. Open the conveyor by splitting the links on the chain.
   c. Attach the replacement chain to the end of the old chain.
   d. Slowly pull the old chain out of the machine and thread the new one into position.
   e. Disconnect the old chain and connect the ends of the new one together.
   f. Move the shaft into position to set the tension of the chain and secure the bearing assemblies.
   g. Check the tension and alignment of the chain frequently during the first 10 hours of operation and set as required. Then, go to the regular maintenance schedule. Normally a conveyor will seat itself during the first 10 hours of operation and then require less adjustment.
5.2.6 ROLLER CHAIN DRIVES

The elevator and rollers are driven by a roller chain system with sprockets and an idler or a tightening system. The roller chain must be oiled on a daily basis and the tension and alignment checked weekly during the season. When maintaining the roller chain, follow this procedure:

1. Daily Oiling:
   a. Open the guards over the elevator and roller drive systems.
   b. Use an oil can or brush to apply oil to the slack side of the chain.
   c. Refer to the following table for oil type.
   d. Close and secure all the guards.

<table>
<thead>
<tr>
<th>CHAIN TYPE*</th>

</tr>
<tr>
<td>RS100</td>
<td>SAE 20</td>
</tr>
<tr>
<td>RS120/MORE</td>
<td>SAE 30</td>
</tr>
</tbody>
</table>

* Stamped on chain link side plate

2. Weekly Sprocket Alignment:
   a. Check alignment by:
      i. Lay a straight edge across the faces of the sprockets. When the straight edge is flush with the faces of the sprockets, they are aligned, or
      ii. Visually sight across the faces of the sprockets. If sprockets are in the same plane they are aligned.
   b. Loosen set screw in sprocket hub if alignment is required.
   c. Move sprocket to required position.
   d. Tighten set screw(s) to their specified torque.
   e. Close and secure all the guards.

\[\text{WARNING}\]

Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.
3. **Weekly Roller Chain Tension:**

   Each roller chain drive system is equipped with a spring-loaded idler sprocket or tension device to maintain the required tension on the chain during operation. Check the idler when the machine is OFF and not moving. There should be some tension on the spring attached to the idler sprocket when the machine is at rest. Without spring tension when stopped, there will not be sufficient tension on the system during operation. Provide spring tension by:

   a. Check the condition of the spring itself. If it has a permanent set, it has reached the end of its useful life and must be replaced.

   b. Shorten the roller chain itself by removing a half link, full link or more until the spring is under tension.

   c. Shorten the roller chain itself by removing a half link, full link or more until tension device again properly tensions the chain.

   ![Warning](Fig. 44 CHAIN TENSION)

   **WARNING**

   Turn power OFF at the master panel and lock-out before performing any maintenance work.
5.2.7 TRASH PUMP BELT DRIVE

Power to the trash pump is routed through a V belt system. The drive must be maintained with the proper belt tension and pulley alignment to obtain the desired performance and life. When maintaining the drive system, follow this procedure:

1. Place all controls in their OFF or neutral position.
2. Turn the power OFF at the master panel and lock-out.
3. Open guard over belt drive system.
4. Belt Tension:
   a. Push on the center of the belt span with a force of approximately 5 lbs.
   b. The belt will deflect approximately 1/4 to 1/2 inch (6-12 mm) when properly tensioned.
   c. Loosen the jam nut on the motor assembly position bolt.
   d. Use the position bolt to move the motor assembly to the required position to properly tension the belt.
   e. Tighten jam nut to its specified torque.

NOTE
Use a matched set of replacement belts for the best results.
5.2.7 TRASH PUMP BELT DRIVE (cont’d)

5. Pulley Alignment:
   a. Lay a straight edge across the face of pulleys to check the alignment.
   b. If the pulley faces are more than 1/16 inch (1.5 mm) from the straight edge, the pulleys must be aligned.
   c. Loosen hub bolts on drive pulley.
   d. Move pulley to desired position.
   e. Tighten hub bolts to their specified torque.

6. Belt Replacement:
   a. Place motor assembly in its loosest position.
   b. Remove old belt and install a new one.
   c. Move the motor into position with the pulleys aligned and the belt tension properly set.
   d. Tighten position bolt jam nut to its specified torque.
   e. Check and adjust the tension and alignment frequently during the first 10 hours of operation until the belt is broken-in.

7. Close and secure the guard.
5.2.8 COMPRESSION ROLLER SPACING

Compression rollers are located under the sponge rollers to remove excess moisture from the sponge rollers as the system turns. Check the compression dimension on a weekly basis. When checking and setting the sponge compression dimension, follow this procedure:

1. Place all controls in their OFF position.
2. Turn the power OFF at the master panel and lock-out.
3. Open the guards over the compression rollers.
4. Measure the thickness of the sponge where the compression roller contacts and does not contact the sponge. This compression dimension should not exceed 1/4 inch (6 mm).
5. Use the threaded rods on corners of the compression roller assembly to set the compression dimension.
6. Close and secure guards.

![Adjustment: Left](image1)

![Adjustment: Right](image2)

**WARNING**

Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.

Fig. 46 COMPRESSION ROLLERS
5.2.9 ROLLER DRIVES

Roller chains are used to transmit power to each of the brush, sponge and compression rollers. Maintain the proper spacing between the sprocket and the backing channel to prevent skipping or jumping by the chain. When maintaining the roller drive, follow this procedure:

1. Place all controls in the OFF position.
2. Turn the power OFF at the master panel and lock out.
3. Open guards over the roller drives.
4. Loosen the channel position bolt jam nuts.
5. Use the position bolt to move the channel to the required position.

**NOTE**
The chain connecting links must be able to move between the channel and the sprocket without binding. Do not move the channel too close to the sprockets.

6. Tighten jam nuts to their specified torque.

**WARNING**
Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.

7. Close and secure the guards.

5.2.10 SYSTEM SPEEDS - DRIVE BELT

The elevator and roller drive systems are designed with a variable sheave V-belt for setting the operating speed of the system. The speed is set from the factory in the middle of its operating rate. To set the system speed, follow this procedure:

1. Place all controls in their OFF position.
2. Turn the power OFF at the master panel and lock-out before performing any maintenance work.
3. Move the motor assembly to set the operating speed. The spring-loaded variable sheave drive pulley will adjust and maintain the required belt tension.
4. Open the guard over the drive system.
5. Move the pulleys closer together to increase operating speed and apart to decrease.
6. Close and secure guard.

WARNING

Machine is shown with guards opened for illustrative purposes only. Do not operate with guards opened.
# 6 TROUBLE SHOOTING

The Mayo Washer uses a flow of water through to soak and scrub potatoes and then remove excess water as the potatoes move through the machine. It is a simple and reliable system that requires minimum maintenance.

In the following section, we have listed many of the problems, causes and solutions to the problems that you may encounter.

If you encounter a problem that is difficult to solve, even after having read through this trouble shooting section, please contact your local Mayo dealer or the factory. Before you call, please have this Operator’s Manual and the serial number from your machine ready.
